## Object Oriented Programming Using Java Week 9

1)

```
Write a Java program to handle ArithmeticException and ArrayIndexOutOfBoundsException.

Create an array, read the input from the user, and store it in the array.

Divide the 0th index element by the 1st index element and store it.

if the 1st element is zero, it will throw an exception.

if you try to access an element beyond the array limit throws an exception.

Input:

5

10 0 20 30 40

Output:

java.lang.ArithmeticException: / by zero
I am always executed

Input:

3

10 20 30

Output

java.lang.ArrayIndexOutOfBoundsException: Index 3 out of bounds for length 3
I am always executed
```

```
1 | import java.util.Scanner;
2 | class prog {
3 | public static void main(String[] args) {
4 | Scanner o = new Scanner(System.in);
5 | int i;
6 | int i = o.nextInt();
7 | int[] arr = new int[];
8 | for(i = 0; i < 1; i++) {
10 | arr[i] = o.nextInt();
11 | }
12 | try {
13 | try {
14 | int c = arr[0] / arr[1];
15 | int d = arr[1];
16 | catch(ArithmeticException e) {
18 | System.out.println(e);
19 | catch(ArrayIndexOutOfBoundsException e) {
20 | System.out.println(e);
21 | finally {
22 | System.out.println("I am always executed");
23 | }
24 | 25 |
26 | }
27 | }</pre>
```

	Test	Input	Expected	Got
~	1	6 1 0 4 1 2 8	java.lang.ArithmeticException: / by zero I am always executed	java.lang.ArithmeticException: / by zero I am always executed
~	2	3 10 20 30	java.lang.ArrayIndexOutOfBoundsException: Index 3 out of bounds for length 3 I am always executed	java.lang.ArrayIndexOutOfRoundsException: Index 3 out of bounds for length 3 I am always executed

```
In the following program, an array of integer data is to be initialized.
     During the initialization, if a user enters a value other than an integer, it will throw an InputMismatchException exception.
     On the occurrence of such an exception, your program should print "You entered bad data."
     If there is no such exception it will print the total sum of the array.
     /* Define try-catch block to save user input in the array "name"
         If there is an exception then catch the exception otherwise print the total sum of the array. */
     Sample Input:
     521
     Sample Output:
     8
     Sample Input:
     2
     1 g
     Sample Output:
   You entered bad data.
| Toport | Java.util.Scanner; | Import | Java.util.Scanner; | Import | Java.util.ImputMisnatchException; | class prog { | Figure | Java.util.ImputMisnatchException; | class prog { | Figure | Java.util.ImputMisnatchException; | class prog { | Figure | Java.util.Topolicy | Java.util.
                         /* Define try-catch block to save user input in the array "name"

If there is an exception then catch the exception otherwise print
the total sum of the array. */
try
{
for(i=0;i<length;i++){
    name[i]=sc.nexInt();
                             {
System.out.println("You entered bad data.");
                Input Expected
                                                                                                            Got
                                      You entered bad data. You entered bad data.
```

3)

	Expected	Got	
~	82 is even. Error: 37 is odd.	82 is even. Error: 37 is odd.	~

Passed all tests! <
